1. Status: Please all the replies and correspondance should be addressed to Examiner's new art unit 2629. Receipt is acknowledged of papers submitted on 02-28-2006 under amendments and new claims have been placed of record in the file. Claims 1-8, 13-17, 21, 25-27, 29, 30 and 32-39 are pending in this action. Claims 9-12, 18-20, 22-24, 28 and 31 are cancelled.

Response to Amendment

2. The amendments to abstract filed on 02-28-2006 under amendments, overcomes the objection to abstract, therefore objection to abstract is withdrawn.

Claim Rejections - 35 USC § 103

- 3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:
 - (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 4. Claims 1, 4-6, 13-17, 21,25-27,29,30,32-35 are rejected under 35 U.S.C. 103(a) as being unpatentable over Tone (U.S. Patent 6,046,712) in view of Margulis et al. (6,157,396).

Regarding **independent claims 1, 13, 21, 29, and 34** Tone teaches an apparatus for providing a gamma voltage correcting apparatus for a liquid crystal display (column 17, lines 60-62; column 59-67, figure 17 at 615a) wherein video data is corrected by a preset gamma voltage to display an image entering desired values for the x- and y-coordinate data Xn and Yn to facilitate the operation of gamma correction (column 14, lines 1-15, figure 16-19 at 615).

Application/Control Number: 09/892,997

Art Unit: 2629

Furthermore, Tone teaches how the apparatus comprises a <u>memory means</u> by <u>external data RAM 403</u> for storing gamma correction for controlling the gamma voltage for each of at least two modes by teaching how the data entry unit 615 enters data to the external data RAM 403 via the external CPU, which activates the <u>mode change signal</u> and the grayscale level such that users can use the data entry unit 615 to write gamma correction data in the external RAM 403 (column 13, lines 28-44, figure 15 at 403, 615).

Also, Tone teaches a control means by teaching CPU 513 which activates the <u>mode change</u> signal and the grayscale level such that users can use the data entry unit 615 to write gamma correction data in the external RAM 403 (column 13, lines 28-44, figure 15 at 403, 615).

Furthermore, Tone teaches a multi-channel gamma voltage generator for responding to the gamma data for a mode selected by the control means to generate n gamma voltages (wherein n is an integer) having a different voltage level indicated by the gamma data for the selected mode by teaching a gamma correction device 400 with external RAM 403 that includes a plurality of grayscale level correction groups wherein each of the grayscale level data sets has a different number n which is the number for dividing the grayscale level range (column 12, lines 10-36, figure 13 at 300, 400).

However, Tone fails to recite or disclose video data modulated by a gamma voltage correction apparatus are applied r to the data lines of a display device, via a column driver; on the other hand Margulis et al. discloses video data modulated by a gamma voltage correction apparatus are applied to the data lines of a display device, via a column driver (Col. 13, Lines 35-47, Line 62 to Col. 14, Line 5, Col. 16, Line 33 to Col. 17, Line 65, Col. 18, Lines 8-26, Col. 19, Line 36 to Col. 20 Line 23, Col. 24, lines 17-23) and Margulis et al. teaches receiving video data (Col. 6, Lines 53-61 receiving industry standard (NTSC, PAL, S-Video) video data) and vertical and horizontal synchronizing signals and outputting the video data and a clock (Col. 7, Lines 4-12, Lines 26-38, Col.9, Lines 1-5 receives composite data has horizontal and vertical timing component and sampling of video

data (clocking) occurs at 100 MHZ). It is well known to a person of ordinary skill in the art, the composite video data such as NTSC, PAL or S-video carries not only video data but also Horizontal, vertical, and clocking information (see Taubman et al. (6,297,851 B1) Col. 1, Lines 11-32, Col. 7, line 53 to Col. 8, Line 13).

Thus, it would have been obvious to a person of ordinary skill in the art to combine Tone and Margulis et al. because while Tone teaches how a CPU 513 activates a <u>mode change signal</u> and the <u>grayscale level</u> such that users can use the data entry unit 615 to write gamma correction data in the external RAM 403 (column 13, lines 28-44, figure 15 at 403, 615), Margulis et al. teaches how the LCD (Col. 6, Line 37) comprises a column driver for correcting the video data by performing gamma <u>correction</u> and supplying the corrected video data to the data lines (Col. 13, Lines 35-47, Line 62 to Col. 14, Line 5, Col. 16, Line 33 to Col. 17, Line 65, Col. 18, Lines 8-26Col. 19, Line 36 to Col. 20 Line 23, Col. 24, lines 17-23). The motivation for combining these inventions would have been to provide optimized a high quality display device (Col. 1, Lines 8-11).

Regarding **claims** 4 and 5, in further discussion of claim 1, Tone teaches how gamma data for the selected mode by teaching a gamma correction device 400 with external RAM 403 that includes a plurality of grayscale level correction groups wherein each of the grayscale level data sets has a different number n which is the number for dividing the grayscale level range (column 12, lines 10-36, figure 13 at 300, 400).

Regarding claim 6, in further discussion of claim 1, Tone teaches how the memory means and the control means are integrated into a single integrated circuit (figure 13 at 400, 312, 403).

Application/Control Number: 09/892,997

Art Unit: 2629

Regarding claims 2, 14-17, 25-27, 30, 32, 33 and 35 in further discussion of claims 13, 21, 29, and 34 Tone teaches a gamma correction device 400 with external RAM 403 that includes a plurality of grayscale level correction groups wherein each of the grayscale level data sets has a different number n which is the number for dividing the grayscale level range (column 12, lines 10-36, figure 13 at 300, 400).

Margulis et al. discloses video data modulated by a gamma voltage correction apparatus are applied r to the data lines of a display device, via a column driver and user controlled (Col. 13, Lines 35-47, Line 62 to Col. 14, Line 5, Col. 16, Line 33 to Col. 17, Line 65, Col. 18, Lines 8-26Col. 19, Line 36 to Col. 20 Line 23, Col. 24, lines 17-23, Col. 24, lines 31-39, Col. 5, Lines 54-58).

5. Claims 3, 7 and 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Tone (U.S.* Patent 6,404,512) in view of Margulis et al. (6,157,396) as applied to claims 1, 4-6, 13-17, 21,25-27,29,30,32-35 above and further in view of *Hiroki (U.S.* 6,771,238).

Regarding claims 3, in further discussion of claim 1, Tone modified by Margulis et al. teaches a gamma correcting apparatus for a liquid crystal display (column 14, lines 1-15, figure 16-19 at 615).

However, Tone modified by Margulis et al. does not teach how the LCD comprises a column driver for correcting the video data using the gamma voltage from the multi-channel gamma voltage generator and supplying the corrected video data to the data lines. On the other hand, Hiroki discloses an active matrix display device, comprising a plurality of pixels arranged in a matrix form a first driver circuit connected to scanning lines and a second driver circuit connected to signal lines (column 4, lines 29-35) wherein the video signal processing circuit 20 mainly performs gamma correction such that the processed video signal is inputted from the source driver circuit 13 through the signal line 18 to the

Application/Control Number: 09/892,997 Page 6

Art Unit: 2629

pixel matrix area 11, thus applied to the pixel electrode of the liquid crystal cell 15 (see column 1, lines 66 through column 2, lines 1-15).

Thus, it would have been obvious to a person of ordinary skill in the art to combine Tone modified by Margulis et al. and Hiroki because while Tone teaches how a CPU 513 activates a mode change signal and the grayscale level such that users can use the data entry unit 615 to write gamma correction data in the external RAM 403 (column 13, lines 28-44, figure 15 at 403, 615) and Margulis et al. discloses video data modulated by a gamma voltage correction apparatus are applied r to the data lines of a display device, via a column driver (Col. 13, Lines 35-47, Line 62 to Col. 14, Line 5, Col. 16, Line 33 to Col. 17, Line 65, Col. 18, Lines 8-26Col. 19, Line 36 to Col. 20 Line 23, Col. 24, lines 17-23), Hiroki teaches how the LCD comprises a column driver for correcting the video data by performing gamma correction and supplying the corrected video data to the data lines (see column 1, lines 66 through column 2, lines 1-15). The motivation for combining these inventions would have been to provide a high quality display device (column 3, lines 15-21).

Regarding **claims** 7 and **8**, in further discussion of claim 3, Hiroki discloses an active matrix display device, comprising a plurality of pixels arranged in a matrix form a first driver circuit connected to scanning lines (column 4, lines 29-35) wherein a timing controller via the video processing circuit 110 facilitates the supply of red, green and blue digital video data to the column driver and for applying a desired timing control signal to the row driver (see column 5, lines 32-62).

Allowable Subject Matter

6. Claims 36-39 are allowed.

7. The following is an examiner's statement of reasons for allowance: The claim 36 was allowed in non-final office action mailed on 11-29-2005, the newly added claims 37-39 depend from independent claim36, therefore after further search and consideration claims 37-39 are also allowable.

A display device having a gamma voltage correcting part, wherein the display device has a display panel that includes a plurality of pixels defined by gate lines and data lines, the display device comprising: a display controller for receiving a first video data and vertical and horizontal synchronizing signals and outputting a second video data and a clock; a lookup table driver connected to the display controller for adjusting color temperature of the second video data and outputting a third video data; the gamma voltage correction part including', a memory for storing at least two sets of gamma data for at least two input modes, a gamma controller for accessing one set of the gamma data in response to a selection signal, a multichannel gamma voltage generator for responding to the one set of the gamma data to generate n gamma voltages (wherein n is an integer) having different voltage levels, and a column driver connected to the display panel, wherein the column driver receives the third video data and the n gamma voltages, and then corrects the third video data using the n gamma voltages and applies the corrected video data to the data lines.

The cited references fails to disclose above underlined bold claim.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Response to Arguments

8. Applicant's arguments filed on 02-28-2006 have been fully considered but they are not persuasive.

Applicant argues regarding claims 1, 13, 21, 34 cited references fail to teach recited limitations receiving video data and vertical and horizontal synchronizing signals; outputting the video data and a clock; implement gamma correction.

Examiner disagrees as Margulis et al. teaches receiving video data (Col. 6, Lines 53-61 receiving industry standard (NTSC, PAL, S-Video) video data) and vertical and horizontal synchronizing signals and outputting the video data and a clock (Col. 7, Lines 4-12, Lines 26-38, Col.9, Lines 1-5 receives composite data has horizontal and vertical timing component and sampling of video data (clocking) occurs at 100 MHZ). It is well known to a person of ordinary skill in the art, the composite video data such as NTSC, PAL or S-video carries not only video data but also Horizontal, vertical, and clocking information (see Taubman et al. (6,297,851 B1) Col. 1, Lines 11-32, Col. 7, line 53 to Col. 8, Line 13) and video data modulated by a gamma voltage correction apparatus are applied to the data lines of a display device, via a column driver (Col. 13, Lines 35-47, Line 62 to Col. 14, Line 5, Col. 16, Line 33 to Col. 17, Line 65, Col. 18, Lines 8-26, Col. 19, Line 36 to Col. 20 Line 23, Col. 24, lines 17-23) and implement gamma correction (Col. 13, Lines 23-46,).

Conclusion

9. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

- 10. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Prabodh M. Dharia whose telephone number is 571-272-7668. The examiner can normally be reached on M-F 8AM to 5PM.
- 11. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.
- 12. Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
